

RS1GT08-Q1 Single 2-Input Positive-AND Gate

1 FEATURES

- Qualified for Automotive Applications
- AEC-Q100 Qualified with the Grade 1
- Operating Voltage Range: 2.0V to 5.5V
- Low Power Consumption: 1μA (Max)
- Operating Temperature Range:
 -40°C to 125°C
- Inputs Are TTL-Voltage Compatible
- High Output Drive: ±32mA at Vcc=5.0V
- Micro SIZE PACKAGES: SC70-5

2 APPLICATIONS

- Fully Qualified for Automotive Applications
- Automotive Infotainment and Cluster
- Automotive Zonal & Body Domain Controller
- Automotive HEV/powertrain
- HEV/EV Battery Management System (BMS)

3 DESCRIPTIONS

The RS1GT08-Q1 single 2-input positive-AND gate is designed for 2.0 to 5.5V V_{CC} operation.

The RS1GT08-Q1 device performs the Boolean function Y=A \bullet B or Y= $\overline{A}+\overline{B}$ in positive logic. The device is fully specified for partial-power-down applications using loff. The loff circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

The RS1GT08-Q1 is available in Green SC70-5 packages. It operates over an ambient temperature range of -40°C to 125°C.

Device Information (1)

|----------------|--------------------|----------------------|-----------------|--|---------------------------------|--------------------|-----------------------|
| RS1GT08 -Q1 | RS1GT08XC5 -Q1 | -40°C ~125°C | SC70-5 (5) | NIPDAUAG | MSL1-260°- Unlimited | 1GT08 | Tape and Reel,3000 |

NOTE:

- (1) This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the right-hand navigation.
- (2) Lead finish/Ball material. Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (3) RUNIC classify the MSL level with using the common preconditioning setting in our assembly factory conforming to the JEDEC industrial standard J-STD-20F, Please align with RUNIC if your end application is quite critical to the preconditioning setting or if you have special requirement.
- (4) There may be additional marking, which relates to the lot trace code information (data code and vendor code), the logo or the environmental category on the device.
- (5) Equivalent to SOT353.

7 PIN CONFIGURATIONS

PIN DESCRIPTION

| PIN | NAME | I/O ⁽¹⁾ | FUNCTION |
|--------|------|--------------------|-----------|
| SC70-5 | NAME | 1/0 (-/ | FUNCTION |
| 1 | Α | I | Input |
| 2 | В | I | Input |
| 3 | GND | Р | Ground |
| 4 | Υ | 0 | Output |
| 5 | Vcc | Р | Power pin |

⁽¹⁾ I=input, O=output, P=power.

8 SPECIFICATIONS

8.1 Absolute Maximum Ratings (1)

over operating free-air temperature range (unless otherwise noted) (1) (2)

| | | | MIN | MAX | UNIT |
|-----------------|---|--------------------------------------|---------|------|------|
| V _{CC} | Supply voltage range | -0.5 | 6.5 | ٧ | |
| Vı | Input voltage range (2) | | -0.5 | 6.5 | ٧ |
| Vo | Voltage range applied to any output in the high-impedan | ce or power-off state ⁽²⁾ | -0.5 | 6.5 | ٧ |
| Vo | Voltage range applied to any output in the high or low st | -0.5 | Vcc+0.5 | ٧ | |
| lıĸ | Input clamp current | V ₁ <0 | | -50 | mA |
| I _{OK} | Output clamp current | V ₀ <0 | | -50 | mA |
| lo | Continuous output current | | | ±50 | mA |
| | Continuous current through V _{CC} or GND | | | ±100 | mA |
| Αιθ | Package thermal impedance (4) | | 380 | °C/W | |
| ΤJ | Junction temperature (5) | -65 | 150 | °C | |
| Tstg | Storage temperature | | -65 | 150 | °C |

⁽¹⁾ Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- (2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The value of V_{CC} is provided in the Recommended Operating Conditions table.
- (4) The package thermal impedance is calculated in accordance with JESD-51.
- (5) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly onto a PCB.

8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

| | | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
| | | Human-Body Model (HBM), per AEC Q100-002 (1) | ±2000 | V |
| V _(ESD) | Electrostatic discharge | Charged-Device Model (CDM), per AEC Q100-011 | ±1000 | V |
| | | Latch-Up (LU), per AEC Q100-004 | ±100 | mA |

⁽¹⁾ AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9 ELECTRICAL CHARACTERISTICS

over recommended operating free-air temperature range (TYP values are at T_A = +25°C, Full=-40°C to 125°C, unless otherwise noted.) (1)

9.1 Recommended Operating Conditions

| PARAMETER | SYMBOL | TEST CONDITIONS | MIN | MAX | UNIT |

NOTES: A. CL includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR ≤ 10 MHz, Zo = 50Ω.
- D. The outputs are measured one at a time, with one transition per measurement.
- E. t_{PLZ} and t_{PHZ} are the same as t_{dis} .
- F. t_{PZL} and t_{PZH} are the same as $t_{\text{en}}.$
- G. t_{PLH} and t_{PHL} are the same as $t_{\text{pd}}.$
- H. All parameters and waveforms are not applicable to all devices.

11 DETAILED DESCRIPTION

11.1 Overview

The RS1GT08-Q1 device is a single 2-input positive-AND gate. The device performs the Boolean AND function $(Y=A \bullet B \text{ or } Y=\overline{A}+\overline{B})$ in positive logic. Low I_{CC} current allows this device to be used in power sensitive or battery-powered applications. Robust inputs allow the device to up-translate with a propagation delay of 4.1 ns.

11.2 Functional Block Diagram

11.3 Feature Description

- The V_{CC} for the device is optimized at 5 V.
- The inputs accept V_{IH} levels of 2 V.
- Output ringing is minimized by slow edge rates.
- Inputs are TTL-Voltage compatible.

12 APPLICATION AND IMPLEMENTATION

Information in the following applications sections is not part of the RUNIC component specification, and RUNIC does not warrant its accuracy or completeness. RUNIC's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

12.1 Application Information

The RS1GT08-Q1 device is a single AND gate, which is often used for many common functions like power sequencing or an on LED indicator. Because the device is configured to output LOW unless all inputs are HIGH, an LED tied to the output of the device will only turn HIGH when all systems connected are sending a HIGH, or ready signal.

12.2 Design Requirements

This device uses CMOS technology and has balanced output drive. Take care to avoid bus contention because it can drive currents that would exceed maximum limits. The high drive also creates fast edges into light loads, so routing and load conditions must be considered to prevent ringing.

13 POWER SUPPLY RECOMMENDATIONS

The power supply pin should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, a 0.1uF capacitor is recommended and if there are multiple V_{CC} terminals then 0.01uF or 0.022uF capacitors are recommended for each power terminal. It is acceptable to parallel multiple bypass caps to reject different frequencies of noise. The 0.1µF and 1µF capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible.

14 LAYOUT

14.1 Layout Guidelines

When using multiple bit logic devices inputs should not ever float. In many cases, functions or parts of functions of digital logic devices are unused; for example, when only two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such input pins should not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. Specified below are the rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that should be applied to any particular unused input depends on the function of the device. Generally, they will be tied to GND or Vcc whichever make more sense or is more convenient.

14.2 Layout Example
